Feature at a Glance

Introducing: API versioning on SAP Ariba Developer Portal

Ease of implementation

Low touch / simple

Geographic relevance

Global

Customer challenge

Our current functionality limits Ariba API publishers to publish only one version of the API, multiple versions are not supported.

Meet that challenge with SAP Ariba

We are now able to publish multiple versions of the API on the developer portal. With this feature, when a new version of an API is released, the developer portal discovery page hosts both versions.

A version indicator located directly below the API name identifies which version of the API is currently displayed on the discovery page for an API. When only one version is available, this version indicator is a simple label. When multiple versions are available, it is a dropdown labeled Version X where X is the displayed version number. Users can opt to switch to a different version by choosing from this dropdown. The most recent version is displayed by default.

Experience key benefits

We will no longer publish different versions of an API as separate APIs on the API discovery page. If multiple versions are available for an API, the version indicator will clearly indicate which version of the API is currently being used. There will be release notes available describing additions and changes to the new API version. Customers can easily switch between versions.

Solution area

This feature is available in:
SAP Ariba developer portal

Implementation information

This feature is enabled for use by all customers registered to use the SAP Ariba developer portal.

Prerequisites and Limitations

Prerequisites: You must be registered to use the SAP Ariba developer portal.
